Professional Summary

Backend Engineer with over three years of experience designing and building backend services, REST APIs, and data-driven applications using Node.js, Express, and TypeScript/JavaScript. Built a multi-cloud cost analytics platform unifying AWS, Azure, GCP, and MongoDB data, and an internal task management system used by production teams. Skilled at designing scalable APIs, integrating third-party and workflow-orchestration services, and taking backend systems from design to production.

Technical Skills

Languages & Frameworks: JavaScript, TypeScript, Node.js, Express, Next.js, React, Bash

Databases: MongoDB, ClickHouse, PostgreSQL

APIs & Integration: REST API design, Argo Workflows API, cloud billing/cost APIs (AWS, Azure, GCP), webhooks

Cloud & Infrastructure: AWS, Azure, GCP, Kubernetes, Docker, Helm

CI/CD & GitOps: GitHub Actions, Azure DevOps, ArgoCD, Argo Workflows

Tools: Git, Bitbucket, Postman

Experience

Tenex Aug 2025 – Present

Backend Engineer

- Built the backend for ts-cloud, a multi-cloud cost analysis application unifying AWS, Azure, GCP, and MongoDB usage and billing data into a single platform for 50+ enterprise clients.
- Designed and implemented APIs for daily, weekly, and monthly cost aggregation and trend analysis across cloud providers and self-hosted services.
- Built a threshold-based cost alerting system that notifies teams in real time when spend spikes or crosses defined limits, improving cost optimization outcomes by 30%.
- Integrated the Argo Workflows API into the application backend, enabling users to create, delete, and pause workflows directly from the platform.
- Built endpoints that surface CI/CD pipeline build status (pass/fail) alongside cost and workflow data in a single unified dashboard.
- Automated ETL pipelines feeding the cost and usage dashboards, cutting manual reporting effort by 45%.

Vizualytic Data Solutions Jul 2023 – Aug 2025

Backend Engineer *Bengaluru, India*

- Built and maintained a Task Management System as a single unified application, consolidating task creation, assignment, status tracking, and notifications for internal teams.
- Designed REST APIs (Node.js/Express) for task CRUD operations with sorting, filtering, and pagination for large task lists.
- Modeled and operated MongoDB collections for the application, including bulk updates and field migrations on large, production-scale collections.
- Debugged and resolved production issues in a .NET API service integrated with the platform's backend.

Projects

Video Streaming Platform – Node.js, Express, MongoDB GridFS

- Built a video streaming website with a Node.js/Express backend, storing video files as chunks in MongoDB using GridFS.
- Streamed video to clients chunk-by-chunk directly from GridFS buckets instead of loading the entire file into server memory at once, reducing memory footprint under load.
- Implemented HTTP range-request support so the backend could serve partial byte ranges, enabling smooth seeking/scrubbing during playback.
- Designed the upload pipeline to chunk and write large video files into GridFS efficiently.

Education

Rajiv Gandhi Prodyogiki Vishwavidhyalaya, Bhopal 2020 – 2024

B.Tech. in Computer Science
