Professional Summary

DevOps Engineer with over three years of experience designing and operating cloud infrastructure, CI/CD pipelines, and Kubernetes workloads across AWS, Azure, and GCP. Reduced cloud costs by more than half and significantly improved deployment speed through Terraform automation and GitHub Actions pipelines. Skilled at building production systems from the ground up and maintaining their stability and reliability at scale.

Technical Skills

Cloud & Infrastructure: AWS (EKS, EC2, S3, IAM), GCP, Azure, Kubernetes, Docker, Helm

CI/CD & GitOps: GitHub Actions, Azure DevOps, ArgoCD, Argo Events, Argo Workflows

Infrastructure as Code: Terraform

Observability: Prometheus, Grafana, Loki, Promtail, Alertmanager

Databases & Data Orchestration: MongoDB, ClickHouse, Dagster

Languages & Tools: Bash, Linux, JavaScript, TypeScript, Node.js, Next.js, Git, Bitbucket

Experience

CompletumHealth Aug 2025 – Present

DevOps Engineer

- Reduced cloud infrastructure costs by 50–60% through workload rightsizing, elimination of idle resources, and reserved capacity planning.
- Strengthened platform security posture by implementing IAM least-privilege access controls, centralized secrets management, and vulnerability scanning across Kubernetes workloads.
- Deployed and operated a self-managed ClickHouse cluster with high availability to support large-scale analytics workloads.
- Operated Dagster in a self-managed, highly available configuration on Kubernetes for production data-orchestration pipelines.
- Maintained and administered production AKS clusters, handling version upgrades, node pool scaling, and workload health monitoring to ensure high availability.

Vizualytic Data Solutions Jul 2023 – Aug 2025

DevOps Engineer *Bengaluru, India*

- Automated CI/CD pipelines using GitHub Actions, reducing deployment effort by 60% and enabling consistent daily releases across staging and production environments.
- Architected Kubernetes clusters with Helm for three or more production services, achieving zero-downtime rollouts with automated rollback on failure and eliminating manual deployment intervention.
- Provisioned cloud infrastructure using Terraform, reducing environment setup time from days to under an hour and eliminating configuration drift across testing, staging, and production.
- Configured ArgoCD and Argo Workflows for GitOps-driven deployments, ensuring declarative cluster state and a full audit trail across all environments.

Projects

Three-Tier Application Platform on GCP – GitOps, Kubernetes, Observability, Scalability

- Designed a GitOps deployment model using ArgoCD with Git as the single source of truth for a three-tier (frontend, backend, data) application on GKE.
- Built reusable Terraform modules covering networking, IAM, Kubernetes, observability, and platform services.
- Provisioned a private GKE platform on GCP, including VPC, Cloud NAT, Cloud Router, Artifact Registry, and Secret Manager, using Gateway API for traffic routing.
- Implemented Workload Identity Federation to remove long-lived cloud credentials from CI/CD pipelines.
- Automated image build, versioning, registry push, and Helm value updates using GitHub Actions, with ArgoCD syncing deployments automatically.
- Enabled cluster scalability through Node Auto-Provisioning and a KEDA-ready autoscaling architecture.
- Integrated centralized metrics and logging using Prometheus, Grafana, Loki, and Promtail for full-stack observability.

Education

Rajiv Gandhi Prodyogiki Vishwavidhyalaya, Bhopal 2020 – 2024

B.Tech. in Computer Science
